

build better, ship faster

Backend Frameworks *Explained Simply.* *Part 2*

Flask (Python)

What is it?

A lightweight Python framework for building web applications and APIs.

Why was it created?

To give developers a simple and flexible way to build web applications without unnecessary complexity.

Why do developers use it?

- Lightweight
- Easy to learn
- Highly flexible

Commonly used for

REST APIs, prototypes, internal tools, small to medium web applications.

Ruby on Rails (Ruby)

What is it?

A full-stack web framework built with Ruby.

Why was it created?

To help developers build web applications faster by following convention over configuration.

Why do developers use it?

- Rapid development
- Built-in features
- Mature ecosystem

Commonly used for

Startups, SaaS platforms, marketplaces, CRUD applications.

Fiber (Go)

What is it?

A lightweight backend framework built for Go.

Why was it created?

To make building fast APIs simple while taking advantage of Go's performance.

Why do developers use it?

- High performance
- Minimal overhead
- Express-like API

Commonly used for

REST APIs, microservices, backend services.

build better, ship faster

Gin (Go)

What is it?

A fast HTTP web framework for Go.

Why was it created?

To provide developers with a simple and efficient framework for building web services.

Why do developers use it?

- Fast routing
- Middleware support
- Lightweight

Commonly used for

Cloud services, APIs, production backend systems.

Phoenix (Elixir)

What is it?

A backend framework built with Elixir.

Why was it created?

To build highly scalable, fault-tolerant, and real-time applications.

Why do developers use it?

- Real-time capabilities
- High concurrency
- Fault tolerance

Commonly used for

Chat applications, live dashboards, messaging platforms.

Actix Web (Rust)

What is it?

A high-performance backend framework built with Rust.

Why was it created?

To help developers build fast and memory-safe web applications.

Why do developers use it?

- Excellent performance
- Memory safety
- Asynchronous support

Commonly used for

Performance-critical APIs, backend services, systems software.

Ktor (Kotlin)

What is it?

A backend framework built with Kotlin.

Why was it created?

To give Kotlin developers a lightweight and flexible way to build backend applications.

Why do developers use it?

- Kotlin-first
- Flexible architecture
- Asynchronous support

Commonly used for

REST APIs, microservices, backend services.

Every backend framework is built with a different goal.

Some prioritize developer productivity.

Some focus on performance.

Others are designed for real-time applications, enterprise software, or large-scale systems.

Understanding what each framework is built for will help you choose the right tool for your next project.

 *Save this guide for future reference.*

 *Comment “CLEAR” if this made backend frameworks easier to understand.*
